Subject: Initiation of Project “J”

Before the creation of Artificial Intelligence, manual recording was the only way for P4N to trace the payments of their clients. It should be noted that manual recording associates with the organization of different categories. Regarding the company, P4N, the following categories of its clients payments are the following: working period, location, department, P4N invoice, invoice issue date, amount, due date, receiving date, status, net amount, net taxable, and sales tax. In addition, manual recording involves the use of different factors to determine new factors. For P4N, the amount of the clients’ payment is entered before the factors, determined by manual calculation, of net amounts, net taxables, and sales taxes, are determined before being written into the spreadsheet, Project J. The manual recording of the payments of P4N’s clients is an inefficient method to keep track of these payments for their clients. However, the automatic recording of these payments promotes P4N’s focus on solutions to fulfill the needs of their clients.
